Whirlpool duet front loading washer error codes

Whirlpool Duet washers are some of the best washing machines on the market, but that doesn't mean they are immune to breaking down from time to time. When they do break down, the inbuilt diagnostic system automatically determines what's wrong with the appliance and displays an error code. In this guide, we will explain all the major Whirlpool Duet washer error codes and give you some tips for how to remove them. This guide covers the following Whirlpool Duet models: WFW70HE WFW80HE WFW81HE WFW94HE WFW95HE WFW96HE WFW97HE WFW8640 WFW86HE WFW8740 WFW87HE WFW88HE Whirlpool error code: SUDS The SUDS error code means your Whirlpool Duet washer has too many soap suds in the washer drum. This is usually the result of using nonhigh-efficiency (HE) washing detergent or using too much detergent. In rare cases, it's the result of a faulty drain pump or pressure sensor. To remove the code, drain your washer, then turn it on to a new cycle. Whirlpool error code: F0E1 This error code means that your washer has detected laundry in your machine during a cleaning cycle. Remove the laundry and the code should disappear. Whirlpool error code: F1E1 This error code means there is a main control fault. To remove the code, reset your washer by turning it off and on. If that doesn't work, you'll need to put your washer through a diagnostic test to determine the problem. Whirlpool error code: F1E2 This error code indicates a motor control fault. The motor control board in your washer has tried to reset but hasn't done so successfully. This means you'll probably have to replace the motor control board. Whirlpool error code: F2E3 This error code indicates a cycle fault. This doesn't happen often but when it does, you'll have to run your washer through a user interface test and check all the connections to the main control board. If any of the connections are faulty, they'll need to be replaced. Whirlpool error code: F3E1 This error code means you have a pressure switch/sensor fault. To fix this error, check the pressure sensing hose for blockages orkinks. If you find it blocked in any way, remove the blockage and the error code should disappear. If the hose is okay, you'll need to test the pressure sensor. Whirlpool error code: F3E2 This error code means you have a temperature sensor fault. This occurs when the sensor cannot determine whether the water temperature in your washer is out of the required range. To fix the error, check the wire connections between the control board and the temperature sensor. If they have become disconnected or faulty, repair or replace them. Whirlpool error code: F5E1 This error code means the door switch may be faulty. To fix this problem,test the door switch. If it's just stuck in the wrong position, try jostling it. If it's faulty, replace it. Whirlpool error code: F5E2 This error code means you have a door lock fault. To fix this error, check the tab on the washing machine door that goes into the door lock to ensure it's not defective. If it is, replace it. If the tab is fine, check the door lock with a multimeter. Whirlpool error code: F5E3 This code means your washer door is unable to unlock. Check that the lock tab on the washer door isn't broken or defective. If the tab is okay, the door lock should be checked with a multimeter. Whirlpool error code: F6E2 and F6E3 This error code means you have a communication fault between the main control board and the washer motor. To solve this problem, check all the wiring between the two components. Repair or replace any faulty wiring that you may find. If no obvious damage can be found, use a multimeter to test the connections. Whirlpool error code: F6E2 and F6E3 This error code means you have a communication fault between the main control board and the user interface. To solve this problem, check all the wiring between the two components. repair or replace any faulty wiring that you may find. If no obvious damage can be found, use a multimeter to test the connections. Whirlpool error code: F7E2 This code indicates a problem with the motor or the motor control board. To fix this problem, start by trying to rotate the drum manually. If the drum doesn't rotate freely, inspect the motor and test it with a multimeter. Whirlpool error code: F8E0 This code indicates a problem with the steam valve (this code is only applicable for steam washer models). To solve the problem, make sure water can get into the steam valve. If water cannot reach the valve, check for blockages and remove any that you may find. Whirlpool error code: F8E1 This code means your Duet washer isn't able to fill with enough water. To solve the problem, make sure the water taps are turned on and that the drain hose is properly connected to your washer. If those two components are fine, check the water inlet valve. If faulty, replace it. Whirlpool error code: F8E2 This code means you have a faulty dispenser motor. To fix the problem, you need to run your Duet washer through a quick diagnostic test. This will determine if the dispenser system is faulty. Whirlpool error code: F8E3 This error code indicates an overflow fault, which means too much water is entering your washer. This problem is usually caused by a faulty water inlet valve, drain pump, or pressure sensor. To fix the problem, check all of those components. If any of them are defective, replace them. Whirlpool error code: F8E4 This error code means you have a flow meter fault, meaning the meter cannot detect whether water is coming into your washer. To fix this, make sure the water supply is turned on and the water hoses aren't blocked. If the flow meter isn't working properly, replace it. Whirlpool error code: F9E1 This error code means you have a problem with your washing machine's drainage system. To fix this problem, check if the drain hose is connected correctly and that it isn't blocked. If the drain hose is fine, the drain pump and the drain filter need to be checked. Bosch washers are amazing appliances — until an error code pops up and they don't work as they should. Fortunately, some error codes may have simple solutions you can do on your own. Check out below for some common Bosch error codes and their possible fixes.Error Code E02 or E2 and Water Supply ProblemsIf you see an E02 or an E2 error on a Bosch front-loading washing machine, you're probably dealing with a problem relating to the machine's water supply. These error codes are essentially telling you the machine isn't able to fill itself with water when the wash cycle is beginning. If the machine is filling with water, the machine is telling you the process is taking longer than it should, giving you this error. Check your home's water pressure make sure the problem isn't within the home versus the machine. Next, check that the machine water supply is actually turned on. If it is, check the water hose to make sure it's not damaged.Error Code E13 and Drainage IssuesIf you see an E13 error pop up on the machine, you're most likely dealing with a drainage problem. Turn off the machine's power, and unplug the washer from the wall before you do anything. You're going to need to follow the detailed instructions in the machine's manual to get to the drain trap and lint filter. Once there, you'll be able to pull out whatever's clogging the machine. Remove the blockage and run a load of laundry while leaving the pump access door off. This way you can ensure the cap is back on properly and there are no further leaks.E17 Error Code and a Locked MachineIf you see the E17 error code while your clothes are still inside the machine, you're most likely experiencing the machine locking itself up, preventing you from taking your clothes out of the machine as well as preventing the water from emptying. One quick fix for the E17 code is to take the machine and slowly tip it backwards. This will allow the water to slowly drain away from the machine, which will then make the machine door open. Error 5 or Error 6 and Water Temperature IssuesIf you notice that an Error 5 or Error 6 code has popped up, it means the machine's water temperature sensor is defective. Unplug the washer. When you're certain it's unplugged, take a look at the washer temperature sensor and reconnect any loose wires. If you notice the wire harness is damaged, replace it. If all of the other connections are okay, reconnect the water sensor. If the problem persists, reach out to a Bosch repairman.Error 14 and the Overfill LevelIf you see error code 14, that code means the machine is sensing the overfill level has been reached. If that's not the case, it probably means the machine water level pressure switch is broken and will have to be replaced. If it's overfilled, shut off the water supply faucet immediately. When this error code is activated, the drain pump runs immediately, emptying out the water. This should prevent the machine from continuing to fill and eventually flooding your space. MORE FROM QUESTIONSANSWERED.NET Modern household appliances are considered to be easy to manage, reliable and multifunctional. But sometimes during the process of washing, these machines could get malfunctions and breakages. That`s why such technique is usually equipped with the self-diagnostic system.The Whirlpool Duet washer is one of such vivid examples. In this article, we described all the Whirlpool Duet error codes and further actions for their determination and correction. So, there is no need for you to contact the service center because simple failures can be fixed by your own. Whirlpool Duet washer signals about a malfunction in two ways: Old models warn by a combination of particular lamps. New washers show error codes on a display. If you understand the meaning of every code, you will be able to "reanimate" the washer by your own. Try to fix it independently or at least inform a specialist about the problem. For those who lost the user manual, we prepared a table filled with codes of the Whirlpool Duet washing machines, where you can find codes and combinations for all washer models. Also, we described the meaning of each error code and gave information what to do to protect a device from a breakdown. Whirlpool Duet Washer Error Codes CodesCauseSolutions FH or HF Water Inlet Problem — no or insufficient water supplySelect PAUSE/CANCEL twice to cancel the cycle. Unplug washer or disconnect power. Check the following: Are water faucets completely turned on? Are screens at inlet hose connection to washer clogged? Are water inlet hoses kinked? Are water inlet hoses frozen? Plug in washer or reconnect power. Re-select cycle and press HOLD TO START. If the problem remains, call for service. F02 Drain ProblemSelect PAUSE/CANCEL twice to cancel the cycle. Unplug washer or disconnect power. Check the following: Is the drain hose kinked? Is the drain hose frozen? Is the drain hose clogged? Is the drain hose more than 96" (2.4 m) above the floor? SUDSuds RoutineWhen excessive suds are detected, a suds routine automatically starts. This routine removes extra suds and assures proper rinsing of your garments. "SUD" is displayed during rinsing and at the end of the cycle to inform you that Suds Routine was activated. To avoid excessive sudsing, reduce HE detergent amounts. F variables [F4 to F16]Electrical ProblemSelect PAUSE/CANCEL twice to cancel the cycle. Select DRAIN/SPIN if there is excessive water in the washer. Re-select cycle and select HOLD TO START. If the problem remains, call for service. Whirlpool Duet Front-Loading Washer Error Codes DISPLAYEXPLANATION AND RECOMMENDED PROCEDURE F/HNo water detected entering machine or Pressure switch trip not detected. If after 30 seconds the control does not detect water entering the machine and then valves will be turned off and the error code will be displayed. Or If the control has turned the water valves on and after 8 minutes the flow meter has detected 10.5 gallons of water passing through it but has not detected the pressure switch trip, the valves will be turned off and the error code will flash. Press PAUSE/CANCEL twice to clear the display. Potential Causes - If there is no water in the unit: • Make sure that both valves at the water source(s) are turned on all the way. • Check for plugged or kinked inlet hoses or plugged screens in the inlet valves • Verify inlet valve operation - If there is water in the unit: • Verify Drain pump operation • Pressure Switch Hose is in good condition and properly connected to Tub and - Pressure switch - Verify there is not a siphon problem - Verify wire harness connections to; Inlet Valves, Pressure Switch, Drain Pump, - Flow Meter, and Central Control Unit (CCU) - Check all hoses for possible leaks - Verify pressure switch operation - Verify flow meter operation - Verify CCU operation F/02Long Drain If the drain time exceeds 8 minutes, the water valves are turned off and "F/02" is flashed. Press PAUSE/CANCEL twice to clear the display. NOTE: After 4 minutes the "Sud" error will be displayed, then 4 minutes later the F/02 error code will be displayed. Potential Causes • Check the drain hose and make sure it is not plugged or kinked • Check the electrical connections at the pump and make sure the pump is running. • Check the drain pump filter for foreign objects • If the above does not correct the problem replace the pump F/05Water Temperature Sensor Error If during the water heating step in the wash cycle, the water temperature sensor (NTC) value is out of range, or the heating element circuit has failed, the "F/05" error code will be displayed. Potential Causes • Check the Water Temperature Sensor, Heating Element, and Element Relay • Check connections to the Sensor, Heating Element and Relay F/06Drive Motor Tachometer Error The control is unable to properly detect motor speed and the machine will shut down. If a failure occurs during high-speed spin the door will be unlocked after 3 minutes. Potential Causes • Check wire harness connections between the Drive Motor/Tachometer and the Motor ControlUnit (MCU), and between the MCU and the Central Control Unit (CCU) • Check the Drive Motor • Check the MCU • Check the Wire Harness F/07Motor Control Unit Error The Central Control Unit has detected a short in the motor control unit. If a failure occurs during high-speed spin the door will be unlocked after 3 minutes. Potential Causes • Check wire harness connections between the Drive Motor and the Motor Control Unit (MCU), and between the MCU and the Central Control Unit (CCU) • Check the MCU • Check the Drive Motor • Check the Wire Harness F/09Overflow Condition If the Overflow contact on the pressure switch is Closed for more than 60 seconds an Overflow condition will occur. In an Overflow condition, the Door will remain locked, and the Drain Pump will run constantly, even if PAUSE/CANCEL is pressed twice and the Display is cleared. Unplug the unit to service. Potential Causes • Check the drain hose and make sure it is not plugged or kinked • Check Wire Harness connections to the Drain Pump, Pressure Switch, and Central Control Unit (CCU) • Check/ Clean Drain Pump Filter of foreign objects • Check Drain Pump Failure • Check the Inlet Valve for proper shut-off • Check the Pressure switch for proper operation F/10Motor Control Unit (MCU) Heat Sink Thermal Trip If the thermal protector on the MCU heat sink gets too hot, it will open the thermal protector on the heat sink which will stop motor functions and a "F/10" will be displayed. Potential Causes • Check for Proper Installation, verify the unit is not located near a source of heat and has proper ventilation. • Check Wire Harness connections to the MCU, the motor, and Central Control Unit (CCU) • Check the Drive System for any worn or failed components • Check MCU Check Motor F/11Serial Communication Error Communication between the Central Control Unit (CCU) and the Motor Control Unit (MCU) cannot be sent correctly. Potential Causes • Check Wire Harness connections to the MCU, the motor, and Central Control Unit (CCU) • Check CCU. F/15Motor Control Unit (MCU) Error If the MCU detects multiple resets or errors during a wash cycle it will go into this error mode. Potential Causes • Check Wire Harness connections to the MCU, the motor, and Central Control Unit (CCU) • Check Drive belt • Check MCU Check Motor • Check Wire Harness SudSUDS LOCK (Overdose of Detergent detected during the Wash Cycle) The motor control unit senses a suds lock condition by analyzing the current draw on the drive motor. If "Sud" is displayed a potential suds lock is detected. This may signify a bad pump, an extra heavy load, excessive detergent, or excessive suds. Potential Causes • If too much detergent was used, run the unit through a Rinse/ Spin cycle then a Normal cycle without adding any detergent. This should clear the unit of the excess detergent. • Check the drain hose and make sure it is not plugged or kinked • Check Wire Harness connections to the Drain Pump, Pressure Switch, and Central Control Unit (CCU) • Check/ Clean Drain Pump Filter of foreign objects • Check Drain Pump • Check the Pressure Switch F13Dispenser Circuit Error If the dispenser motor is not able to be driven to its proper position. Potential Causes • Check mechanical linkage from dispenser motor to the top of the dispenser. • Check Wire Harness connections to the dispenser motor and Central Control Unit (CCU) • Check Dispenser Motor F/14EEPROM Error The Central Control Unit (CCU) receives its data from an EEPROM onboard the CCU. If there is an error reading this data it will cause this error. Potential Causes • A power glitch may cause this error. Try unplugging the Unit for two minutes to see if that fixes the error. • Check CCU. F/dlDoor Lock Error A Door Lock Error occurs if the door cannot be locked. It will try to lock it 6 times before displaying the error. Potential Causes • Door Lock Mechanism broken or removed from the Door • Check Door Lock/Switch Assembly • Check the wire harness connections to the Door Lock/Switch Assembly and Central Control Unit (CCU) • Door Lock/Switch Assembly Failure F/dUDoor Unlock Error A Door Unlock Error occurs if the door cannot be unlocked. It will try to unlock the door 6 times before displaying the error. Potential Causes • Door Lock Mechanism broken. • Check Door Lock/Switch Assembly for foreign objects • Check Wire Harness connections to the Door Lock/Switch Assembly and Central Control Unit (CCU) • Door Lock/Switch Assembly Failure Note: The Door Lock/Switch Assembly can be manually unlocked. Whirlpool duet sports Washer Error Codes ERROR CODEMEANINGSOLUTION "Spin" and "Wash" (HT "Rinse" and "CycleComplete") illuminated or "F20 (or FH)" on displayWater Inlet Problem—no water or insufficient water supplySelect PAUSE/CANCEL twice to cancel the cycle. Unplug washer or disconnect power. Check the following: Are both hot and cold water faucets completely turned on? Are screens at inlet hose connection to washer clogged? Are water inlet hoses kinked? Are water inlet hoses frozen? Plug in washer or reconnect power. Re-select cycle and press START. If the problem remains, call for service. "Spin", "Wash" (HT "Rinse","Cycle Com-plete") and "Add a Garment" illuminated or"F21 (or F02)" on displayDrain ProblemSelect PAUSE/CANCEL twice to cancel the cycle. Unplug washer or disconnect power. Check the following: Is the drain hose kinked? Is the drain hose frozen? Is the drain hose more than 96" (2.4 m) above the floor? Plug in washer or reconnect power. Re-select cycle and press START. If the problem remains, call for service. "SUD" is displayed during rinsing to inform you that Suds Routine was activated. Use only HE (High Efficiency) detergents. "F22" Front door lockSelect PAUSE/CANCEL twice to cancel the cycle. Check the following: Is the washer door firmly shut? The door must be completely closed for the washer to operate. The door may look closed, but may not be latched. Open the door and close firmly. Were you washing a large load? Before you close the washer door, check for laundry items sticking out beyond the door opening. Leave enough space in the washer to allow the clothes to tumble freely. An tightly packed basket may keep the door from shutting completely. Reduce your load size if needed. Press POWER and select START "F" codes other than F20, F21, or F22Select PAUSE/CANCEL twice to cancel the cycle. Select DRAIN/SPIN if there is excessive water in the washer. Re-select cycle and press START. If the problem remains, call for service. Any other Status light combinationElectrical ProblemSelect PAUSE/CANCEL twice to cancel the cycle. Select DRAIN/SPIN if there is excessive water in the washer. Re-select cycle and press START. The statistics of malfunctions of the Whirlpool Duet washers show the most common problems: Drainage path is littered. A water pump is worn away and broken. The electronic control board is out of order. In most cases, the reason of breakage is in burnt control trials or in a worn away mechanical control device. Heater or thermostat is broken down. Tank seal, nozzles or cuff start to leak. Motor brushes are worn away. The drive belt is broken. Motor contact starts to burn. Bearings or shock absorbers are worn away. There is a foreign object in a washer.
